

# CALCULUS AND PROBABILITY BASED STATISTICS

MARK ANDREW GERADS

## 1. FINITE STATISTICS

**1.1. Introduction.** The purpose of this text is to have statistics built on a solid foundation of probability and calculus.

**Definition 1.1.**  $A$  is a repeatable event.

**Definition 1.2.**  $p$  is the probability that  $A$  will happen when  $A$  is given a chance to happen. For simplicity, we assume that  $p$  is the same every time  $A$  is given a chance to happen.

**Definition 1.3.**  $n \in \mathbb{W}$  is the number of times  $A$  had a chance to happen.

**Definition 1.4.**  $k \in \mathbb{W}$  is the number of times  $A$  actually happened.

*Remark 1.5.*  $k \leq n$ .

**Definition 1.6.**  $f_p$  is the probability is the probability distribution for  $p$ .

*Remark 1.7.*  $1 = \int_0^1 f_p dp$

**Definition 1.8.**  $m$  is the maximum value of  $f_p$ .

**Definition 1.9.**  $(a, b)$  is the prediction interval of  $p$  such that  $b - a$  is minimized.

**Definition 1.10.**  $c$  is the desired certainty for the prediction interval of  $p$ .

*Remark 1.11.*  $0 \leq c = \int_a^b f_p dp \leq 1$

*Remark 1.12.*  $0 \leq a \leq b \leq 1$

Now that we have the definitions, here is the problem:  $n, k, c$  are known, and we must solve for  $a, b$ .

*Remark 1.13.* The probability of  $k$  events given  $n$  chances is  $\binom{n}{k} p^k (1-p)^{n-k}$ , but we must scale it to satisfy 1.7:

$$(1.1) \quad f_p = \frac{\binom{n}{k} p^k (1-p)^{n-k}}{\int_0^1 \binom{n}{k} p^k (1-p)^{n-k} dp} = \frac{p^k (1-p)^{n-k}}{\int_0^1 p^k (1-p)^{n-k} dp} = (n+1) \binom{n}{k} p^k (1-p)^{n-k}$$

### 1.2. The 4 cases of finding the interval.

1.2.1. *Case*  $n = k = 0$ . This case is self-symmetrical.

*Remark 1.14.* We have

$$(1.2) \quad (a, b) = \left( \frac{1-c}{2}, \frac{1+c}{2} \right)$$

1.2.2. *Case*  $n > k = 0$ . This case is symmetrical to case 1.2.3.

*Remark 1.15.* We can solve

$$(1.3) \quad \int_0^b (n+1)(1-p)^n dp = c = 1 - (1-b)^{n+1}$$

*Remark 1.16.* We have

$$(1.4) \quad (a, b) = \left( 0, 1 - (1-c)^{\frac{1}{n+1}} \right)$$

1.2.3. *Case  $n = k > 0$ .* This case is symmetrical to case 1.2.2.

*Remark 1.17.* We can solve

$$(1.5) \quad \int_a^1 (k+1)p^k dp = c = 1 - a^{k+1}$$

*Remark 1.18.* We have

$$(1.6) \quad (a, b) = \left( (1-c)^{\frac{1}{k+1}}, 1 \right)$$

1.2.4. *Case  $n > k > 0$ .* This case is self-symmetrical.

*Remark 1.19.* We desire to solve

$$(1.7) \quad \int_a^b (n+1) \binom{n}{k} p^k (1-p)^{n-k} dp = c = (n+1) \binom{n}{k} (B_b(k+1, -k+n+1) - B_a(k+1, -k+n+1))$$

where  $B$  is the incomplete beta function.

*Remark 1.20.* We can use the hint

$$(1.8) \quad a^k (1-a)^{n-k} = b^k (1-b)^{n-k}$$

*Remark 1.21.* By solving

$$(1.9) \quad \frac{\partial f_p}{\partial p} = 0$$

, we get

$$(1.10) \quad \lim_{c \rightarrow 0} (a, b) = \left( \frac{k}{n}, \frac{k}{n} \right), m = (n+1) \binom{n}{k} \left( \frac{k}{n} \right)^k \left( 1 - \frac{k}{n} \right)^{n-k}$$
