CALCULUS AND PROBABILITY BASED STATISTICS

MARK ANDREW GERADS

1. Finite statistics

1.1. **Introduction.** The purpose of this text is to have statistics built on a solid foundation of probability and calculus.

Definition 1.1. A is an independently repeatable event.

Definition 1.2. $p \in [0,1]$ is the probability that A will happen when A is given a chance to happen. For simplicity, we assume that p is the same every time A is given a chance to happen.

Definition 1.3. $n \in \mathbb{W}$ is the number of times A had a chance to happen.

Definition 1.4. $k \in \mathbb{W}$ is the number of times A actually happened.

Remark 1.5. $k \le n$.

Definition 1.6. f_p is the probability distribution for p.

Remark 1.7. $1 = \int_0^1 f_p dp$

Remark 1.8. k/n is the expected probability of p and is where the maximum value of the function f_p is.

Definition 1.9. (a,b) is the confidence interval of p such that b-a is minimized.

Definition 1.10. c is the desired certainty for the confidence interval of p.

Remark 1.11. $0 \le c = \int_a^b f_p dp \le 1$

Remark 1.12. 0 < a < b < 1

Remark 1.13. The symmetry mentioned is where you swap p with 1-p and k with n-k and A with n-k

1.2. **The Problem.** n, k, c are known, and we must solve for a, b.

Remark 1.14. The probability of k events given n chances is $\binom{n}{k} p^k (1-p)^{n-k}$, but we must scale it to satisfy 1.7:

$$(1.1) f_p = \frac{\binom{n}{k} p^k (1-p)^{n-k}}{\int\limits_0^1 \binom{n}{k} p^k (1-p)^{n-k} dp} = \frac{p^k (1-p)^{n-k}}{\int\limits_0^1 p^k (1-p)^{n-k} dp} = (n+1) \binom{n}{k} p^k (1-p)^{n-k}$$

1.3. The 4 cases of finding the interval.

1.3.1. Case n = k = 0. This case is self-symmetrical.

Remark 1.15. We have

(1.2)
$$(a,b) = \left(\frac{1-c}{2}, \frac{1+c}{2}\right)$$

Date: February 25, 2016.

1

1.3.2. Case n > k = 0. This case is symmetrical to case 1.3.3.

Remark 1.16. We can solve

(1.3)
$$\int_0^b (n+1)(1-p)^n dp = c = 1 - (1-b)^{n+1}$$

Remark 1.17. We have

(1.4)
$$(a,b) = \left(0, 1 - (1-c)^{\frac{1}{n+1}}\right)$$

Example 1.18. Now we can analyze the old saying "Third time's the charm.". n = 2.

$$(1.5) c = 0.5 \Rightarrow b \approx 0.2062994740, c = 0.95 \Rightarrow b \approx 0.6315968501$$

We can now see that if you fail at something twice, then success before the 8th try is worth approximately a coin flip. The expected time to find success can be calculated through this formula: $\left\lceil n + \frac{1}{h} \right\rceil$.

Example 1.19. Suppose we were repeatedly trying a difficult task. How many times of trying without success must there be for us to conclude with c = 0.99 that $b \le 0.01$?

(1.6)
$$n = \frac{2\log(3) + \log(11)}{2\log(2) - 2\log(3) + 2\log(5) - \log(11)} \approx 457.2105766$$

We can see "If at first you don't succeed, try, try again." is sensible for things that we want to be certain are improbable before giving up.

1.3.3. Case n = k > 0. This case is symmetrical to case 1.3.2.

Remark 1.20. We can solve

(1.7)
$$\int_{a}^{1} (k+1)p^{k} dp = c = 1 - a^{k+1}$$

Remark 1.21. We have

(1.8)
$$(a,b) = \left((1-c)^{\frac{1}{k+1}}, 1 \right)$$

1.3.4. Case n > k > 0. This case is self-symmetrical.

Remark 1.22. We desire to solve

(1.9)

$$\int_{a}^{b} (n+1) \binom{n}{k} p^{k} (1-p)^{n-k} dp = c = (n+1) \binom{n}{k} \left(B_{b}(k+1, -k+n+1) - B_{a}(k+1, -k+n+1) \right)$$

where B is the incomplete beta function.

Remark 1.23. We can use the hints

(1.10)
$$a^{k}(1-a)^{n-k} = b^{k}(1-b)^{n-k}$$

Remark 1.24. By solving

$$\frac{\partial f_p}{\partial p} = 0$$

, we get

$$\lim_{c \to 0} (a, b) = \left(\frac{k}{n}, \frac{k}{n}\right), m = (n+1) \binom{n}{k} \left(\frac{k}{n}\right)^k \left(1 - \frac{k}{n}\right)^{n-k}$$

1.4. Table of small trial half probability intervals. Table with $c = \frac{1}{2}$:

1.1. Iak	ne or small trial half	-			1
	k = 0	k = 1	k=2	k = 3	k=4
n = 0	$a \approx 0.2500000000$				
	$b \approx 0.7500000000$				
n = 1	$a \approx 0.000000000$	$a \approx 0.7071067812$			
	$b \approx 0.2928932188$	$b \approx 1.000000000$			
n = 2	$a \approx 0.000000000$	$a \approx 0.326351822$	$a \approx 0.7937005260$		
	$b \approx 0.2062994740$	$b \approx 0.673648178$	$b \approx 1.000000000$
